

# Gods Web

Generated on: 2023-03-03 01:25:44.629037

This report presents the results of God's Web, which is designed to evaluate the configuration of an OWASP Web Application Firewall (WAF) against the OWASP Core Rule Set (CRS) best practices. The tool assesses whether each CRS rule is present in the WAF configuration and ensures that the security levels of each rule cannot be lower than the CRS guidelines. The results of the audit tool are presented in the following sections, providing key findings and recommendations for improving the WAF configuration to align with CRS best practices.

## Overview

The security level score of the current WAF rules are compared to CRS guideline, the closer the score is to the guideline, the more closely the security level aligns with best practices.

Obtained Score: 1405 / 2026

## Compliance

The following pie chart shows the distribution of WAF rules that are included in the guideline but are not present in the WAF, expressed as a percentage of the total number of WAF rules.

# WAF Breakdown

The following pie chart shows the distribution of WAF rules that are included in the ModSecurity Core Rule Set (CRS) and custom rules, expressed as a percentage of the total number of WAF rules.

The following bar graph shows the distribution of WAF rules enabled on the WAF for the most common types of web attacks, as reported by TrustNet

# Rule Header

The following rules have different request\_header

## Severity

---

The severity level of a rule in ModSecurity CRS affects the score that is assigned to a particular event or anomaly detected by that rule. Each severity level has a different weight or impact on the overall score that is calculated for a particular request.

The severity levels are as follows:

**CRITICAL (level 5):** Indicates that the anomaly detected by the rule is very severe and requires immediate attention. A request that triggers such a rule would be assigned a high score, which would indicate that it is likely an attack.

**ERROR (level 4):** Indicates that the anomaly is serious and could result in a security breach if not addressed. A request that triggers such a rule would be assigned a high score, which would indicate that it is potentially malicious.

**WARNING (level 3):** Indicates that the anomaly is of moderate severity and could potentially lead to a security issue. A request that triggers such a rule would be assigned a lower score than a critical or error-level rule.

**NOTICE (level 2):** Indicates that the anomaly is of low severity and may not necessarily indicate an attack or security issue. A request that triggers such a rule would be assigned a low score.

It is important to configure the WAF rules based on the severity of the application's security needs. If the configured WAF rules have a lower severity than the OWASP CRS Guideline rules, it may result in a higher risk of successful attacks.

The following rules have different severity

| Rule ID | Configured Severity | Recommended Severity |
|---------|---------------------|----------------------|
| 949110  | CRITICAL            | None                 |

## Action

In ModSecurity, "pass", "deny", and "block" are actions that can be taken by a rule when a request or response matches that rule.

"pass" means that the rule will be skipped and the request/response will be allowed to continue through the WAF without being blocked or flagged as an anomaly.

"deny" means that the request will be blocked, and the client will receive a response indicating that their request was denied.

"block" is similar to "deny" in that it also blocks the request, but it also generates an event that can be logged and alerts the WAF administrator to the attempted attack.

These actions are usually associated with the severity level of a rule, with higher severity rules being more likely to "deny" or "block" a request. The specific actions taken by a rule depend on the configuration of the WAF, including the desired level of protection, the sensitivity of the protected application, and the likelihood of false positives.

Having current configured rules to have lower restrictive actions such as "pass" when it should be a higher restrictive action such as "deny" can leave the system vulnerable to attacks.

The following rules have different actions:

| Rule ID | Configured Action | Recommended Action |
|---------|-------------------|--------------------|
| None    | pass              |                    |
| 901001  | pass              | deny               |
